

"Yesterday, a terrible rainstorm happened in the morning. Children were carried away by the river, including my little bro. So even now, we are trying to find others. It's sad"

But - we had a good ending in our village!

A day ago-

"Hey Nina. Thank God Almighty, we found the children who were lost. We are fine now. It's raining nonstop. So we need to guard the kids."

-Primacy

Cholera, a water-borne disease caused by ingesting contaminated food or water, often spreads quickly throughout Zimbabwe because of its poor sanitation infrastructure and limited clean water.

If we can plant trees near the rivers, we can strengthen the shore and help reduce flooding. The river washed away all the clay and left only sand this time. But we can plant again wherever it is still possible.
